                                                                                                                                                                         Sequence 9, Application US/09935727

Patent No. US20020150583A1

GENERAL INFORMATION:

APPLICARIT: Human Genome Sciences, Inc.

TITLE OF INVENTION: Tumor Necrosis Factor Receptors 6 Alpha and FILE REFERENCE: PF454P2

CURRENT PELING DATE: 2001-08-24

PRIOR PELICATION NUMBER: 06/234, 24

PRIOR PELICATION NUMBER: 60/237, 24

PRIOR PELICATION NUMBER: 60/227, 598

PRIOR PELICATION NUMBER: 60/227, 598

PRIOR PELICATION NUMBER: 60/227, 598

PRIOR FILING DATE: 2000-01-21

PRIOR PELICATION NUMBER: 60/18, 931

PRIOR FILING DATE: 1999-12-01

PRIOR PELICATION NUMBER: 60/146, 371

PRIOR PELICATION NUMBER: 60/146, 371

PRIOR PELICATION NUMBER: 60/113, 964

PRIOR PELICATION NUMBER: 60/113, 964

PRIOR PELICATION NUMBER: 60/113, 704

PRIOR PELICATION NUMBER: 60/113, 704

PRIOR PELICATION NUMBER: 60/113, 704

PRIOR PELING DATE: 1999-04-30

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

C;Comment: This receptor is found on sensory and sympathetic neurons, on neuroblasto C;Comment: The cysteine-ritch region of the extracellular domain may form part or all C;Comment: This protein is thought to form a high-affinity receptor when it associate
C;Comment: This receptor undergoes both N- and O-linked glycosylation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A,Map position: 17q21-17q22

The development of lymphomas in families with autoimmune
I ymphoproliferative syndrome with germline Fas mutations and
defective lymphocyte apoptosis.";
I blood 98:194-200(5001).
LEUWCTION: Receptor for TNFFF6/FASL. The adaptor molecule FADD
recruits caspase-8 to the activated receptor. The resulting death-
inducing signaling complex (DISC) performs caspase-8 proteolytic
cactivation which initiates the subsequent cascade of caspases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This SWISS-FROT entry is copyright. The adaptor molecule FADD recruits caspase-8 to the activated receptor. The resulting death-inducing signaling complex (DISC) performs caspase-8 proteolytic activation which initiates the subsequent cascade of caspases (aspartate-specific cysteine proteases) mediating apoptosis. FAS-mediated apoptosis may have a role in the induction of peripheral tolerance, in the antigen-stimulated suicide of mature T-cells, or both (By similarity).

--- SUBCELLULAR LOCATION: Type I membrane protein.

--- TISSUE SPECTRICITY: DETECTED IN VARIOUS TISSUES INCLUDING THYMUS, LIVER, LUNG, HEART, AND ADULT OVARY.

--- DOMAIN: CONTAINS A DEATH DOMAIN INVOLVED IN THE BINDING OF FADD, AND MAYBE CYTOSOLIC ADAPTOR PROTEINS.

                U. Blochem. Biophys. Res. Commun. 198:666-674(1994).

1. FUNCTION: Receptor for TWRSF6/FASL. The adaptor molecule FADD recruits caspase-8 to the activated receptor. The resulting death-inducing signaling complex (DISC) performs caspase-8 proteolytic activation which initiates the subsequent cascade of caspases (aspartate-specific cysteine proteases) mediating apoptosis. FAS-CO mediated apoptosis may have a role in the induction of peripheral both (By similarity).

1. SUBCELLIAR LOCATION: Type I membrane protein.

2. I- SUBCELLIAR COOTION: Type I membrane protein.

2. I- DOMAIN: CONTAINS TO DEATH DOMAIN INVOLVED IN THE BINDING OF FADD, CONTAINS TO THE CYS REPEATS.

2. I- SIMILARITY: CONTAINS 1 DEATH DOMAIN.

--- SUBCELLULAR LOCATION: Type I membrane protein.
--- TISSUE SPECIFICITY: Highly expressed in heart, lung and kidney
--- INDICTION: TWERSETOB is regulated by the tumor suppressor p53.
--- SIMILARITY: CONTAINS 3 TWER-CYS REPEATS.
--- SIMILARITY: CONTAINS 1 DEATH DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     and kidney

Cell 8:169-179(2001).

-1- FUNCTION: Receptor for TNFSF14/LIGHT and homotrimeric
TNFSF1/1/mphotoxin-alpha. Involved in lymphocyte activation. Plays
an important role in HSV pathogenesis because it enhanced the
entry of several wildtype HSV strains of both serotypes into CHO
cells, and mediated HSV entry into activated human T cells.
-1- SIBCELLUIAR LOCATION: Type I membrane protein (Probable).
-1- TISSUE SPECIFICITY: WIDELX EXPRESSED, WITH THE HIGHEST EXPRESSION
                                                                                                                                                                                                                  SEQUENCE FROM N.A.

Tumor necrosis factor receptor superfamily member 10A precursor (Death receptor 4) (TNF-related apoptosis-inducing ligand receptor 1) (TRAIL-R1)
THERSF10A OR DR4 OR TRAILR1 OR APO2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  -1. SUBGUIT: Can interact with TRADD and RIP.
-1. SUBGUIT: Can interact with TRADD and RIP.
-1. SUBCELLUIAR LOCATION: Type I membrane protein.
-1. TISSUE SPECIFICITY: Widely expressed. High levels are found in spleen, peripheral blood leukocytes, small intestine and thymus, but also in K562 erythroleukemia cells, MCF7 breast carcinoma cells and activated T-cells.
-1. SIMILARITY: CONTAINS 3 TNFR-CYS REPEATS.
-1. SIMILARITY: CONTAINS 1 DEATH DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                MEDLINE-98090092; PubMed-9430227;
Chaudhary P.M., Eby M., Jasmin A., Bookwalter A., Murray J., Hood L.
"Death receptor 5, a new member of the TNFR family, and DR4 induce
Imbordependent apoptosis and activate the NF-kappaB pathway.";
-I. FUDD-dependent apoptosis and activate the NF-kappaB pathway.";
-I. FUNCTION: Receptor for the cytotoxic ligand TNFSF10/TRAIL. The
adaptor molecule FADD recruits caspase-8 to the activated
receptor. The resulting death-inducing signaling complex (DISC)
performs caspase-8 porteolytic activation which initiates the
subsequent cascade of caspases (aspartate-specific cysteine
proteases) mediating apoptosis. Promotes the activation of NF-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Apoptosis; Transmembrane; Glycoprotein; Repeat; Signal.

-1 SUBCELLULAR LOCATION: Type I membrane protein.
-1 AND A SHORT FORM/TRICK2A; A REE PRODUCED BY ALTERNATIVE SPLICING.
-1 TISSUE SPECIFICITY: Widely expressed in adult and fetal tissues; covery highly expressed in tumor cell lines such as Hele 33, K562, HL-60, SW480, A549 and G361; highly expressed in heart, peripheral blood lymphocytes, liver, pancreas, spleen, thymus, prostate, covary, uterus, placenta, testis, esophagus, stomach and throughout the intestinal tract; not detectable in brain.
-1 INDUCTION: TWERSF10B is regulated by the tumor suppressor p53.
-1 INDUCTION: TWERSF10B is regulated by the tumor suppressor p53.
-1 INDUCTION: TWERSF10B may be a cause of squamous cell carcinoma of the head and neck.
-1 SIMILARITY: CONTAINS 3 TWERCYS REPEATS.
-1 SIMILARITY: CONTAINS 1 DEATH DOMAIN.

Struct. Biol. 6:1048-1053(1999).

-! FUNCTION: Receptor for the cytocoxic ligand TNFSF10/TRAIL. The adaptor molecule FADD recruits caspase-8 to the activated receptor. The resulting death-inducing signaling complex (DISC) performs caspase-8 proteolylic activation which initiates the subsequent cascade of caspases (aspartate-specific cysteine proteases) mediating apoptosis. Promotes the activation of NF-

-1- SUBCELLULAR LOCATION: Secreted.
-1- TISSUE SPECIFICITY: Highly expressed in adult lung, heart, kidney, liver, spleen, thymus, prostate, ovary, small intestine, thyroid, liver, spleen, thymus, prostate, ovary, small intestine, thyroid, lymph node, trachea, adrenal gland, testis, and bone marrow. Detected at very low levels in brain, placenta and skeletal muscle. Highly expressed in fetal kidney, liver and lung.
-1- INDUCTION: Upregulated by increasing calcium-concentration in the medium and estrogens. Downregulated by glucocorticoids.
-1- PTM: N-glycosylated. Contains slalic acid residues.
-1- PTM: N-terminus may be blocked.
-1- SIMILARITY: CONTAINS 2 DEATH DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     FUNCTION: Acts as decoy receptor for RANKL and thereby neutralizes its function in osteoclastogenesis. Inhibits the activation of osteoclasts and promotes osteoclast apoptosis in vitro. Bone homeostasis seems to depend on the local RANKL/OPG ratio. May also play a role in preventing arterial calcification. May act as decoy receptor for TRAIL and protect against apoptosis. TRAIL binding blocks the inhibition of osteoclastogenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                              MEDLINE-99269100; PubMed-9603945; Emery J.G., McDonnell P., Burke M.B., Deen K.C., Lyn S., Silverman C., Dul E., Appelbaum E.R., Eichman C., DiPrinalo R., Dodds R.A., James I.E., Rosenberg M., Lee J.C., Young P.R.; "Osteoprofegerin is a receptor for the cytotoxic ligand TRAIL."; J. -i- TISSUE SPECIFICITY: Highly expressed in liver, lung, stomach, intestines and calvaria. Highly expressed in decidua and placenta,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           -1- INDUCTION: Upregulated by TGF-beta and estrogens. Downregulated by 1,25-dihdroxyvitamin D3 and parathyroid hormone.
-1- SIMILARITY: CONTAINS 4 TNFR-CYS REPEATS.
-1- SIMILARITY: CONTAINS 2 DEATH DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DEVELOPMENTAL STAGE: Detected in embryo at high levels on day 7, whereas expression decreases at day 11 and increases from day 15 to 17. On day 15 found in developing bone primordia, brachiocephalic artery and ductus arteriosus, left main bronchus, abdominal aorta and midgut.
                                                                                                                                                                                                                                                                                                   [2]
